CookenPro 4.0 is USDA Approved

Barrington Software is pleased to announce that its software application, CookenPro CN Version, has again been USDA approved for implementing Nutrient Standard Menu Planning (NSMP). CookenPro was initially approved in May 2008 with the CN 12 database but each year the USDA releases an updated database and does a check to determine that the new database has been correctly incorporated into the software. The CN 13 database includes all updates from the USDA Standard Reference 21 Database, including 202 new items.

CookenPro is an affordable software alternative for [schools](#) and [retirement communities](#). The program was evaluated by the USDA Software Evaluation Team, which consists of the Software Evaluation Coordinator and nutritionists at USDA's Food and Nutrition Information Center. Before the USDA can approve a program, all required functions must be incorporated into and working correctly in the program.

In addition to providing accurate nutrient analysis of recipes and menus, CookenPro provides integrated inventory functions. Users can create an inventory requisition from a menu, combination of menus, or part of a menu and deduct the quantities from inventory.

For more information about CookenPro, contact info@barringtonsoftware.com or call 888-394-0047.

Did You Know?

With CookenPro, an entire cycle menu can be saved as a new menu with a new starting date?
